

the future of dentistry . . . dental implants

Until recent decades, the best and only way to replace many missing teeth was with dentures or bridges. But the truth is, no one wants dentures, because no one wants to have teeth that they can take out.

It is common knowledge amongst all Dentists that there is a downhill spiral when we are missing teeth, and missing a few teeth puts extra pressure on the other teeth until they too will eventually fail.

“no one wants to have teeth that they can take out”

Back in 1965, Pj Branemark discovered what today is the Dental Implant industry. He discovered that bone grows onto and bonds firmly to titanium surfaces. Therefore by placing a titanium implant into your jaw, the bone will bond firmly creating a solid foundation for a replacement tooth.

Since the advancements of Dental Implants in the 1980s, Dental Implants have become the standard for replacing teeth. The theory of using dentures and bridges to replace all teeth has been challenged and dental implants, in appropriate situations, have many great advantages.

We are very confident that any mouth can be rehabilitated with Bone Grafting and Dental Implants today.

Digital technology today gives us the ability for very accurate imaging, and virtual dental implant planning allows for safe, predictable and comfortable Dental Implant surgery.

Dental Implant Treatment is indicated in any mouth with missing teeth and suitable bone quantity and quality.

“Dental Implants have become the standard for replacing teeth”

The Pattern of Tooth Loss:

Dental Implant Treatments have become necessary because:

- By living longer, you are outlasting your teeth
- Modern Diets are destroying your teeth
- Previous decay and gum disease may have caused damage
- Previous dental care may have weakened your teeth
- Changes in anatomy of your jaw when teeth are lost
- Dental Implants give you long-term health
- Dental Implants give you comfortable teeth

The replacement of a single missing tooth has many advantages:

- + high success rate (above 97% at 10 years)
- + decreased risk of decay on adjacent teeth
- + decreased risk of root canal on adjacent teeth
- + improved ability to clean in between teeth
- + improved aesthetics of adjacent teeth
- + maintains bone
- + improves survival of adjacent teeth

A personalised Smile Artistry™ Dental Implant Plan will detail how you can achieve a healthier mouth with Dental Implants. Call today on **3870 3344** to make a time to see if Dental Implants can help you smile again.

**When all teeth are missing,
an old denture can bite with only 6psi force
in comparison to a normal bite of 200psi.**

Dental Implants

the tooth replacement solution

BIOHORIZONS®
